A41185
alpha-2 macroglobulin MUG1 - mouse
C;Species: Mus musculus (house mouse)
C;Date: 28-May-1992 #sequence_revision 28-May-1992 #text_change
C;Accession: A41185
C;Accession: A41185
J. Biol. Chem. 266, 16903-16910, 1991
A;Title: Molecular characterization of the murinoglobulins.
A;Reference number: A41185; MUID:91358495; PMID:1840592
A;Accession: A41185
A;Status: preliminary
A;Molecule type: mRNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     MEDLINE=99081553;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  FOR DIFFERENT PROTEINASES. WHEN A PROTEINASE CLEAVES THE BAIT REGION, A COMPORMATIONAL CHANGE IS INDUCED IN THE PROTEIN WHICH TRAPS THE BROTEINASE. THE ENTRAPED ENZYME REMAINS ACTIVE AGAINST LOW MOLECULAR WEIGHT SUBSTRATES (ACTIVITY AGAINST HIGH MOLECULAR WEIGHT SUBSTRATES (ENTIVITY AGAINST HIGH MOLECULAR WEIGHT SUBSTRATES IS GREATLY REDUCED). FOLLOWING CLEAVAGE IN THE BAIT REGION A THIOLESTER BOND IS YENDROLYZED AND MEDIATES THE COVALENT BINDING OF THE PROTEIN TO THE PROTEINASE.

SUBUNIT: HOMOTETRAMER, WHICH CONSISTS OF TWO PAIRS OF DISULFIDELINKED CHAINS.

TISSUE SPECIFICITY: Plasma.

MISCELLANEOUS: CONTRARY TO THE RAT PROTEIN, WHICH IS AN ACUTE PHASE PROTEIN, THIS PROTEIN IS ALWAYS PRESENT AT HIGH LEVELS IN CITECULATION.
                                                                                                                                                                                                                                                                                                                                                                                                                                                       CIRCULATION.

FUNCTION: IS ABLE TO INHIBIT ALL FOUR CLASSES OF PROTEINASES BY A UNIQUE "TRAPPING" MECHANISM. THIS PROTEIN HAS A PEPTIDE STRETCH, CALLED THE 'BAIT REGION' WHICH CONTAINS SPECIFIC CLEAVAGE SITES FOR DIFFERENT PROFEINASES. WHEN A PROTEINASE CLEAVES THE BAIT REGION, A CONFORMATIONAL CHANGE IS INDUCED IN THE PROTEIN WHICH TRAPS THE PROTEINASE. THE ENTRAPED ENZYME REMAINS ACTIVE AGAINST LOW MOLECULAR WEIGHT SUBSTRATES (ACTIVITY AGAINST HIGH MOLECULAR WEIGHT SUBSTRATES (BOND IS YDROLVZED AND MEDIATES THE BAIT REGION A THIOLESTER BOND IS SYDROLVZED AND MEDIATES THE COVALENT BINDING OF THE PROTEIN TO THE PROTEINASE.

SUBUNIT: HOMOTETRAMER, WHICH CONSISTS OF TWO PAIRS OF DISULFIDE-TIME TO THE PROTEINASE.
                                                                                                                                            FIRST INCREASES, THEN DECREASES AFTER A MAXIMUM. SIMILARITY: TO OTHER PROTEINS OF THE ALPHA-MACRO INCLUDING COMPLEMENT COMPONENTS C3, C4, AND C5.

"Molecular characterization of the murinoglobulins.";

J. Biol. Chem. 266:16903-16910 (1991).

-i- FUNCTION: A PROTEINASE ACTIVATES THE INHIBITOR BY SPECIFIC PROTEOLYSIS IN THE BAIT REGION, WHICH, BY AN UNKNOWN MECHANISM LEADS TO REACTION AT THE CYSTEINYL-GLUTAMYL INTERNAL THIOL ESTER SITE AND TO A CONFORMATIONAL CHANGE, WHEREBY THE PROTEINASE IS TRAPPED AND/OR COVALENTLY BOUND TO THE INHIBITOR. WHILE IN THE TETHRAMERIC PROTEINASE INHIBITORS STERIC INHIBITION IS SUFFICIENTLY STRONG, MONOMERIC FORMS NEED A COVALENT LINKAGE BETWEEN THE ACTIVATED GLUTAMYL RESIDUE OF THE ORIGINAL THIOL ESTER AND A TERMINAL AMINO GROUP OF A LYSINE OR ANOTHER NUCLEOPHILIC GROUP ON THE PROTEINASE, FOR INHIBITION TO BE EFFECTIVE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              A2M1_MOUSE

Biochemistry 28:9324-9331(1989).

-i- FUNCTION: IS ABLE TO INHIBIT ALL FOUR CLASSES OF PROTEINASES BY A UNIQUE "TRAPPING" MECHANISM. THIS PROTEIN HAS A PEPTIDE STRETCH, CALLED THE 'BAIT REGION' WHICH CONTAINS SPECIFIC CLEAVAGE SITES FOR DIFFERENT PROTEINASES. WHEN A PROTEINASE CLEAVES THE BAIT REGION, A CONFORMATIONAL CHANGE IS INDUCED IN THE PROTEIN WHICH TRAPS THE PROTEINASE. THE ENTRAPPED ENZYME REMAINS ACTIVE AGAINST LOW MOLECULAR WEIGHT SUBSTRATES (ACTIVITY AGAINST HIGH MOLECULAR WEIGHT SUBSTRATES IS GRATLY REDUCED). FOLLOWING CLEAVAGE IN THE BAIT REGION A THIOLESTER BOND IS HYDROLYZED AND MEDIATES THE COVALENT BINDING OF THE PROTEIN TO THE PROTEINASE.

-i- SUBBUNIT: HOMOTETRAMER, WHICH CONSISTS OF TWO PAIRS OF DISULFIDE-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         J. Biol. [5]
